

Parker Maritime is working closely with Statoil – an international energy company and the world’s largest offshore oil operator

The customer’s requirement

The Johan Sverdrup field consists of two discoveries, Avaldsnes and Aldous, and is located 140km due west from Stavanger in the Norwegian sector of the North Sea at a depth of abt. 120m.

The field was discovered in 2010 and is turning out to be one of the largest discoveries ever made on the Norwegian continental shelf. Johan Sverdrup is expected to produce up to 380,000 barrels of oil per day during the first phase and will produce up to 650,000 barrels of oil per day when fully commissioned.

The development is expected to account for more than half of Norway’s oil production by 2040. Statoil has decided to develop a field center consisting of four jacket type platforms.

Statoil needed an independent company to follow up on the dimensional control at various sites around the world, where the various platform modules are being produced.

The solution

Parker Maritime was awarded the contract for 3rd party verification and dimensional control in September 2016, and is currently in the delivery phase for the project.

The contract is a significant win for Parker Maritime, and represents a recognition of the presence and competencies we have developed through serving the offshore Oil & Gas sector since 1974.

The jackets and topsides are being produced in Norway, South-Korea, The Netherlands and Spain. The assignment requires our team to be flexible and draw on our considerable experience and long experience in executing dimensional control and verification on large offshore constructions.

Key factors for success

- Knowledge in utilizing the right tools
- Long experience - 50 years in Oil&Gas
- Professional operators
- Good communication towards the Client
- Problem solver for the Client
- High quality

Key features

- Increased confidence levels
- Consultants for the Clients
- As-built dimensional control
